Notes

- All resistors named as RA* must have at least 1% tolerance
- All non-polarized capacitors named as CA* must use NP0 Temp. Coef.
- All other non-polarized capacitors should use X7R Temp. Coef.
- Decoupling caps must be placed as close as possible of the IC power pins

USB outp Power: 1.5A
Inp Power: 12V 700mA

By connecting the 2 test pins the board boots in revocery mode

Op Amp Bypass capacitors

GC2, GC1	GAIN (dB)
1, 1	0.0
1, 0	6.0
0, 1	15.0
0, 0	20.4

The gain calculation includes the RDSon value

J110: RDSon = 18R

The CODEC only presents optimal dynamic range and THD+N for PGA setting: −12dB to +6dB.

Op Amp Bypass capacitors

*** The outputs are not balanced ***

.....

The Ring pin is actually a low impedance input, and any signal on it is added to the output signal. This will make a balanced input see only the signal, and provides exactly the same level (and even ground loop compensation) to an unbalanced input.

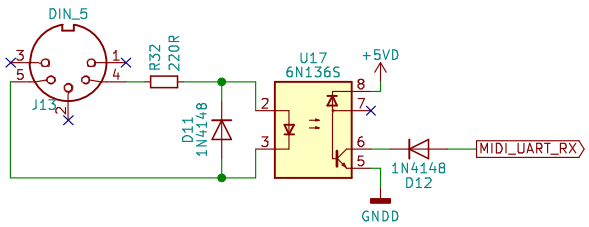
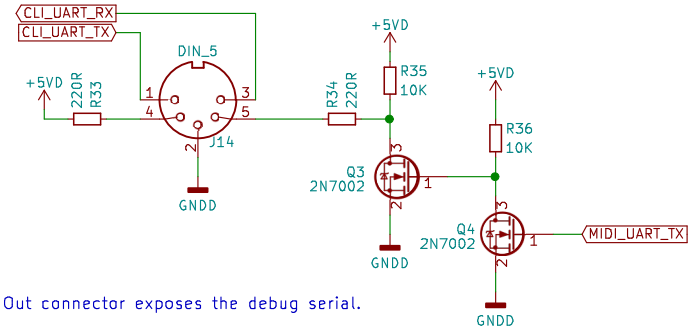
MIDI IN

Opto:
If = 16mA, Vf = 1.4V



MIDI In connector can be used to trigger a special boot mode by connecting pin 3 to GND.

MIDI OUT



MIDI Out connector exposes the debug serial.
